Converting a PC Document to a Page Segment

Note: To perform the following task, you need a PC document, in a folder, that contains IMDS format or IOCA function set 10 image data. To create a PC document, do the following:

1. If necessary, ask the system administrator to add a directory entry (ADDDIRE) for your user ID.
2. Create a folder using the Create Folder (CRTFLR) command.
3. On a personal computer that is connected to the server and has iSeries Access shared folder function running on it, create an IMDS format or an IOCA function set 10 image data file with an image handling program.
4. On the personal computer, copy the file to a document in a shared folder.

In the following examples, the following names are used:

IOCAFLR for the folder name

LOGO for the PC document name

MYLIB for the library name

LOGO for the page segment name

You may change these names to your own names.

Example Actions:

1. Type 21 on the Selection or command line in the display.
2. Press the Enter key.

The Convert to Page Segment display appears:

Convert to Page Segment

Type choices, press Enter.

Page segment	LOGO	Name
Library	MYLIB	Name, *CURLIB
Source object type	1	1=PC document, 2=File

F3=Exit F5=Refresh F12=Cancel
