

FINANCIAL SUMMARY

Prevailing in a year of supply chain disruptions

2024 was a year with macroeconomic pressures, geopolitical tensions and unpredictability. Despite this, A.P. Moller - Maersk (Maersk) showed resilience in 2024 and doubled down on core logistics activities, supporting the integrator strategy. Following the unprecedented pandemic peak in 2022 and the inventory correction seen in 2023, 2024 reflected a strong rebound in profitability, far surpassing pre-pandemic levels and culminating in the third-best year in Maersk's history.

Revenue illustrated in quarters

Revenue

USDbn

55.5bn

(USD 51.1bn)

Q1

Coming out of a year of normalisation, Q1 results reflected the disrupted network and supply chain impacts of the Red Sea situation. While freight rates consequently went up, they were partially offset by the normal seasonal volume decline in Ocean. Cost control measures put in place in 2023 started to materialise, and the refocusing on core business in Logistics & Services resulted in the stabilisation of revenue.

Q2

Revenue continued to increase sequentially as the Red Sea situation became entrenched. Container demand strengthened, and supply chain disruptions continued. Revenue per move increased in Terminals, and increasing volumes in Logistics & Services resulted in the beginning of recovery, with sequential growth of 3.7%. A general rebound began to emerge, with revenue trending above the pre-pandemic levels of 2020 and early 2021.

Q3

Freight rates peaked as supply chain pressure did not dissipate during the quarter and demand continued to be strong. Geopolitical tensions persisted, acting as the main source of volatility for the economy and for trade and logistics. Volumes were up across segments, and the rebound in profitability stemmed from peak rates, generally higher volumes and continued SG&A cost control, reaping the benefits of cost measures put in place during 2023.

Q4

Container demand, while starting to weaken in Q4, remained relatively strong as Ocean volumes increased from the previous year and minimally decreased from Q3. Ocean loaded freight rates declined by 18% from the Q3 peak as anticipated capacity began to enter the market. Despite rate volatility in the logistics industry, revenue remained stable in Logistics & Services. Terminals finished the year strong, with a 17% increase in revenue year-over-year.

EBIT

USDbn

6.5bn

(USD 3.9bn)

EBIT increased by USD 2.6bn with positive impacts from higher freight rates and improved volumes across all segments.

Free cash flow

USDbn

5.1bn

(USD 4.0bn)

Free cash flow increased by USD 1.1bn due to increased profit for the year by USD 2.3bn, partly offset by the negative effect of increased net working capital compared to the unwinding seen in 2023, as well as increased CAPEX.
